

Ruido

"Ruido" is the deformation of a digital rectangular prism depending on the noise of the keys on a keyboard. These transformations allow us to see how the prism, in turn, is made up of numerous smaller rectangles, just like the keyboard is made up of its keys and the image is its pixels. "Ruido" is a claim of the quadrature permanently present in the digitization process, both in the prior discretization of the data and in the final display form.
